DETAILED ACTION

Response to Arguments

1. The amendment filed on 04/13/2010 is acknowledged and entered by the examiner.

Information Disclosure Statement

2. The information disclosure statement (IDS) submitted on 05/20/2010 has been considered by Examiner and made of record in the application file.

Claim Status

3. Claims 1, 3, 5-13, 16-20, 22-24, 27 and 28 are currently pending in the instant application. Claims 2, 4, 14, 15, 21, 25 and 26 have been canceled.

Reasons for Allowance

4. Claims 1, 3, 5-13, 16-20, 22-24, 27 and 28 are allowed over the prior art record.
5. The following is an examiner's statement of reasons for allowance:

The applicant's remarks, filed on 04/13/2010, have been carefully reviewed with updated search. Consequently, reasons for allowance of claims 1, 3, 5-13, 16-20, 22-24, 27 and 28 are set forth in according to the following:

Derango et al. (US PAT. 5,761,193) teaches network access delays are minimized by using affiliation messages to pre-establish communications in a wireless communication network. In a first embodiment, connections between a site and a multicast server are not pre-assigned. A controller, upon receiving an affiliation message from a site, establishes connections between the site and a multicast server, the connections being uniquely associated with a talkgroup/site affiliation indicated by the affiliation message. In a second embodiment, connections between the site and the multicast server are pre-arranged. Thus, responsive to the affiliation message received from the site, the controller informs the multicast server that a talkgroup is affiliated with the site. Regardless of whether the first or second embodiment is used, the multicast server routes packetized information corresponding to the talkgroup to those sites with which the talkgroup is affiliated.

Ericsson, Motorola, Siemens, Nokia (User Requirements V1.1.1 (2003-10) provided by the Applicant on 02/27/2004) teaches the user requirements for a Push to Talk over Cellular system and for Push to Talk over Cellular features. This document contains also operator requirements for a Push to Talk over Cellular system.

Consider claim 1, the prior arts made of record, alone or in combination, fails to clearly teach or fairly suggest a user device capable of walkie-talkie-like functionality configured to participate in dispatch calls through a dispatch network, the user device being further configured to: obtain from the dispatch network a user-device specific set of at least one provisioned talk group identifier having a respective provisioned talkgroup identifier for each talkgroup provisioned for the user device; and make

information pertaining to the at least one provisioned talkgroup identifier available to a user of the user device, the at least one provisioned talkgroup identifier being maintained by the dispatch network; wherein the user device is a wireless device comprising a message generation and processing function configured to: transmit a first message to the dispatch network to request the respective provisioned talkgroup identifier for each talkgroup provisioned for the user device; and receive at least a second message from the dispatch network containing the provisioned talkgroup identifier(s), as specified in the independent claim 1, and further limitations of their respective dependent claims 3, 5-12, 27 and 28.

Consider claim 13, the prior arts made of record, alone or in combination, fails to clearly teach or fairly suggest a dispatch network configured to provide dispatch services to user devices capable of walkie-talkie-like functionality, the dispatch network being configured to: maintain for each user device a user-device specific set of at least one provisioned talk group identifier having a respective provisioned talkgroup identifier for each talkgroup provisioned for the user device; and provide to each user device the user-device specific set of at least one provisioned talkgroup identifier upon an event other than talkgroup opt in; wherein the user devices are wireless devices and the dispatch network comprises a message generation and processing function configured to: receive a first message from a particular user device requesting the respective provisioned talkgroup identifier for each talkgroup provisioned for the user device; and transmit at least a second message containing the provisioned talkgroup identifier(s), as

specified in the independent claim 13, and further limitations of their respective dependent claims 16-19.

Consider claim 20, the prior arts made of record, alone or in combination, fails to clearly teach or fairly suggest a method of provisioned talkgroup discovery in a system comprising a dispatch network and a plurality of user devices, the method comprising: the dispatch network maintaining for each user device a user-device specific set of at least one provisioned talk group identifier having a respective provisioned talkgroup identifier for each talkgroup provisioned for the user device; a user device of the plurality of user devices being a wireless device capable of walkie-talkie-like functionality transmitting a request to the dispatch network for the user-device specific set of at least one provisioned talk group identifier: the dispatch network receiving the request and responding with a response containing the user-device specific set of at least one provisioned talk group identifier and the user device receiving the response and making the provisioned talkgroup identifiers available to a user of the user device, as specified in the independent claim 20, and further limitations of their respective dependent claims 22-24.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
